NOKIA 9110 COMMUNICATOR: REMOTE SYNCHRONISATION OF CALENDAR DATA TO PC WITH PC SUITE'S INTELLISYNC

Calendar data in the Nokia 9110 Communicator can be remotely synchronised to Calendar data in the user's PC; i.e. over a data call (TCP/IP connection)

The software package for PC connectivity contains a special module "Intellisync" which allows either local synchronisation (when the communicator is connected to the computer via cable or IR) or remote synchronisation (sync via a phone call) of calendar data

Intellisync allows you to configure and run "Remote" as well as "Local-" synchronisations of Calendar data. A remote synchronisation is a synchronisation that you can run remotely, over a datacall.

Please refer to the communicator User's manual for instructions on operation, care and maintenance, including important safety information.

Requirements:

- A PC connected to the internet (or a LAN)

- PC Suite installed and running on that PC

- The screensaver must be disabled

    PLEASE NOTE: A computer running Intellisync needs to be accessible from the Internet. If it is behind a firewall, you must have a direct dial-in access to the LAN to be able to connect to the PC with your Communicator.
    PLEASE NOTE: It is advisable to synchronise locally first before synchronising remotely.

- A configured Internet access point in the Nokia 9110 Communicator

- Data services activated on your GSM subscription. (the SIM card)

Settings:

- After installation of PC Suite for the Nokia 9110 Communicator the settings for both local and remote synchronisation can be set.

- Settings for the Intellisync are performed locally when the communicator is connected to the PC

- Settings are performed in the same way as with local sync.

- Notifications and confirmations cannot be used in the remote synchronisation

- "**Add**" is the default Conflict Resolution setting; **Ignore** and **Notify** options cannot be used.

- PC applications that require you to type a password for access during synchronisation cannot be synchronised.

- Only Calendar and "To-do-list" data can be synchronised.

Running a Remote Synchronisation:

In order to run a remote synchronisation, you must have an Internet access point to facilitate the remote connection to your PC. In addition, PC Suite for the Nokia 9110 Communicator must be up and running on your PC.

NOTE: A computer running Intellisync needs to be accessible from the Internet. As most computers reside behind firewalls you must have a direct dial-in access to the LAN to be able to connect to the PC with your Communicator.

- In the Nokia 9110 Communicator Remote Synchronisation/Settings define the IP address of the computer running Intellisync, and the Internet access point you want to use.

- Note: The remote synchronisation process needs the IP-address of the PC/server that contains the synchronised data. If a dynamic IP address is used, the current IP address must be solved with, for example, a Ping command.

- Press Start to start a datacall and begin the synchronisation. When the synchronisation is complete, the datacall ends.

- The synchronisation is now performed and the conflicts resolved between calendar dates.
